■ DESCRIPTIONS

For the various measuring requirement, the CS2 series' R&D is destined with high accuracy measurement, display, control and communication (Modbus RTU mode) such as AC voltage/Current, DC process signal 0~10V/4~20mA(with square root function), Strain Gauge/Load Cell, Potentiometer, Resistance, Temperature and so on.

The CS2 series designed with 3 external control input (ECI) in standard version and the extra optional with 4 Relay, 1 Analogue and 1 RS485 port which it's available all-in-one together with the display functions, beside above it still available extra the programmable such as max/mini hold, PV hold, relative PV.....etc that it's more flexible & more useful in the testing equipment field & others' territories.

In applications, they are not only indicators but also the I/O interfaces which it's compatible with any systems. ADtek built-in the innovation concept for External Control input(ECI) and Relay output similar as I/O module of PLC. It's very simply & easily to achieve remote monitoring and control simultaneously.

■ FEATURES

- User friendly, easily programmable operated smoothly by the front panel
- 3 external control inputs in standard for Relative PV(Δ PV or Tare) / PV Hold / Maximum or Minimum Hold / DI / Reset for Relay Energized Hold....
- 4 relay in option for Hi / Lo / Hi Latch / Lo Latch / Go / DO energized with Start Delay / Hysteresis / Energized & De-energized Delay / Relay Energized Hold..... functions
- Analogue output and RS 485 communication port are optional.

[CS2-VA VOLT / CURRENT METER RELAY]

- Measuring Voltage 0~600V or Current 0~10A ; DC / AC / TRMS
- Accuracy: AC: $\pm 0.1\%$ f.s.; DC: $\pm 0.04\%$ f.s.; Display Range: -19999~+29999
- 4 banks pre-set in option for all relay functions are relative to 4 difference scaling, and be selectable by 3 External Control Inputs (ECI) or front key.

[CS2-PR DC SIGNAL INDICATOR]

- Measuring DC 0~10V or 0(4)~20 mA(with square root function) in one indicator(input code: AV)
- Accuracy: $\pm 0.04\%$ f.s.; Display Range: -19999~+29999

[CS2-SG STRAIN GAUGE INDICATOR]

- Measuring ranges of Load Cell or Strain Gauge from 0~1.0/~2.0/~4.0 mV/V or 0~10.0/~20.0/~40.0 mV/V and specified with excitation supply DC 5V or 10V, 40mA.
- Accuracy: $\pm 0.04\%$ f.s. ; Display Range: -19999~+29999
- Field calibration of load cell or strain gauge to meet the system requirement with high/low calibrations which it saved the test time and keep accuracy

[CS2-PM POTENTIOMETER INDICATOR]

- Measuring Potentiometer 0~50 Ω /~2.0K Ω ; 0~2.0K Ω /~100.0K Ω (3 wires)
- Accuracy: $\pm 0.04\%$ f.s. ; Display Range: -19999~+29999
- Field calibration of potentiometer to meet the system requirement with high/low calibrations which it saved the test time and keep accuracy

[CS2-RS RESISTANCE INDICATOR]

- Measuring Resistance 0~200.00Ω/2000.0Ω/20.000KΩ/200.00KΩ (2 wires)
- Accuracy: ± 0.04% f.s. ; Display Range: -19999~+99999
- Field calibration of resistance to meet the system requirement with high/low calibrations which it saved the test time and keep accuracy
- 4 banks pre-set in option for all relay functions are relative with 4 difference scaling, and be selectable by 3 External Control Inputs (ECI) or front key.

[CS2-T TEMPERATURE INDICATOR]

- Measuring Pt100Ω; T/C: K,J,E,T(the range will be fix, please specified the exactly input type in ordering)
- Accuracy: Pt100: ± 0.1% f.s.; T/C: ± 0.2% f.s.; Display Range: -19999~+29999

■ APPLICATIONS

■ Models

- **CS2-VA** Switch Boards / Motor Control / Machinery / Testing Equipments
- **CS2-PR** Machinery Control / Process Control Systems for pressure, level,.....sensing transducers Automation System / Testing Equipments
- **CS2-SG** Weighting indication, control and Alarm / Machinery Control / Tension and others test equipment
- **CS2-PM** Position indication, control and Alarm / Machinery Control / Angle of Value Control / Tap of transformer indication
- **CS2-RS** Resistance test as like as coil of transformer or motor indication
- **CS2-T** Temperature measuring

■ Functions

- **Safety & Protection** Hi/Lo alarm and latch($\overline{H.HLD}$ / $\overline{L.oHLd}$), Analogue output limited($\overline{R.oL.nE}$)
- **Testing & Measuring** Maximum/Minimum hold($\overline{H.R.Hd}$ / $\overline{M.inHd}$), PV hold($\overline{P.uHLd}$), Relative PV/Tare/ Δ PV($\overline{REL.PU}$), Banks($\overline{bnE-}$), Field calibration with sensor
- **Remote Monitoring & Control** RS485 communication port, Remote display($\overline{F.5485}$), Remote monitoring(\overline{di}) and Remote control for Relay energized(\overline{do})

■ FUNCTION DEFINE

■ Character Symbol

A	b	C	d	E	F	G	H	i	J	K	L	M
R	b	[d	E	F	G	H	,	J]	L	n
n	o	P	q	r	S	t	U	v	W	X	y	Z
n	o	P	q	r	S	t	U	v	W	X	y	Z
1	2	3	4	5	6	7	8	9	0	/	.	
i	2	3	4	5	6	7	8	9	0	r	.	

■ Input & Scaling

■ Input Range

Programming range: 0.00~100.00% of input range

The meters had been set the input range as per order code (ex. 0~10V or 4(0)~20mA) in factory. If the meters requested to convert into difference inputs ranges, the meters can be switched function [R.L.o] and [R.H.i] in [INPUt GROUP] to meet the input signal. For example:

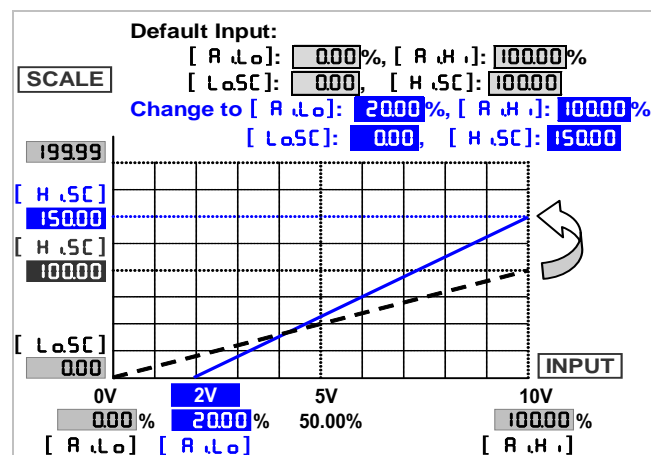

The meter is 0~10Vdc input, and the signal from sensor is 2~10Vdc. Please enter into the [INPUt GROUP] to set [R.L.o] (Analogue input Low) to be 2000% (10V x 20.00% = 2V), then the meter has been converted the input range into 2~10Vdc and the all relative parameters be processed by 2~10V.

■ Input type [R.E.YP] for CS2-PR

**Programming range: Voltage:0~10V/0~5V/1~5V;
Current: 4~20mA/0~20mA/0~10mA**

It supports dual type input 0~10V and 0(4)~20mA between 3 terminals in one meter. Please specify the

ordering code AV for input range. And, programming the function [R.E.YP] to co-ordinate with the input range and wiring terminals.

*Lower resolution display may be caused by the setting the less decimal point such as "100". If requested high resolution must with more decimal point such as "100.00".

■ Scaling Function [L.oSC] & [H.iSC]

Programming range: -19999~+29999counts

Setting the [L.oSC] (Low scale) and [H.iSC] (High scale) in [INPUt GROUP] which are relative to input signal. Reverse scaling will be set too. Please refer to the below figures as following,

*Lower resolution display may be caused by more narrow scale. If the [A.L.O] & [A.H.I] have been changed, the [L.S.C] & [H.S.C] will be related to the new setting of [A.L.O] & [A.H.I].

Display Functions

Max / Mini recording

In order to review & trace the drifting PV, the meters will keep the values of maximum and minimum in [user level] during power on. User can reset the values by [Reset] in [user level]. And it'll record new maximum and minimum value immediately after reset.

Display function [dSPly] for display screen

The [dSPly] function in [INPUT GROUP] can be set to show present value [PV], Maximum Hold [Max Hold] or Minimum Hold [Min Hold] or Remote display by RS485 command [5485]. Please refer to following for detail.

Present value [PV]

Display screen will show the value that is relative to input and [L.S.C] (Low scale) and [H.S.C] (High scale) setting.

Maxi. Hold [Max Hold] or Mini.m Hold [Min Hold] for PV

When the [dSPly] function in [INPUT GROUP] set to be [Max Hold] (Max. Hold) or [Min Hold] (Mini. Hold), that the meter will still display the value of PV in maximum (or minimum) and the relative square orange LED will be bright during power on, With manual reset as below:

- 1) By front key in [user level], Up/Down Key function set.
- 2) ECI terminals closed.

The meter will update immediately new maximum (minimum) values after ECI is opened, or press Up/Down Key again. The Reset functions will be described in ECI functions.

Please paste the sticker on the right side of orange square LED to identify the status of display.

Remote display [5485] by RS485 command

In past, The meter normally receive 4~20mA or 0~10V from AO card or BCD card of PLC. We built-in a new solution by RS485 which it can writing the value to the display screen so that saving costs of AO and wiring connecting to PLC simultaneously.

When the [dSPly] function set to be [5485], the LED display no longer appear the input signal on the meter then the PV screen will display the data from RS485 command. The data (number) will be same function as PV which it will compare with set-point, analogue output and ECI functions.

PV (Present value) Hold [PV Hold]

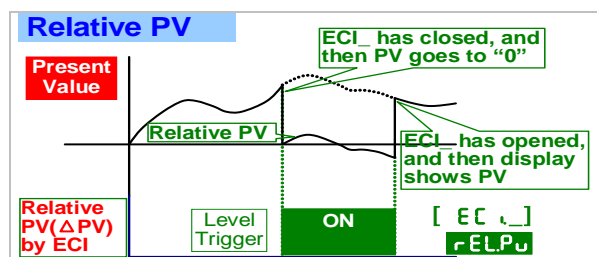

When the [ECI] (External Control input) set to be [PV Hold] (PV Hold) function in [ECI GROUP], that display will be hold & kept, and the relative green LED will be bright, when the ECI terminals been closed or pressed Up/Down Key function been set (the 1st times), until the ECI is to be opened or press Up/Down Key again (the 2nd times).

Please paste the sticker on the right side of green square LED of ECI to identify the status of display.

Relative PV (ΔPV) or Tare [REL PV]

The [ECI] can be set to be [REL PV] (Relative PV) function. When the ECI is closed, the reading will show the differential value with PV or Tare either.

Low Cut [LoCut]

Settable range from -19999~+29999 digits.

The users can set the value range.

- 1) if set the positive value (X1) here to display "0" which it expressed to be low-cut the PV between "+X1 (plus)" & "-X1 (minus)" / absolute value
 $PV < | \text{Setting value (X1)} |$, the display will be shown 0
 EX: Low Cut is set for 0.50. If the display is from -0.50~+0.50, that will be 0.

- 2) If set the negative value (X2) here to display "X2" which it expressed to be low-cut the PV that it's under the X2 setting value;
 $PV < \text{Setting value (X2)}$, the display will be shown X2.

EX: Low Cut is set for -0.01. If the display is < -0.01, and all the display will be -0.01.

Digital Fine Adjustment [P_u2r_o] & [P_u5P_n]
Settable range from -19999~+29999 ;

Users can get "Fine Adjustment PV" by front key on the meter for lower and/or higher points. "Just Key-In" the value, if user wants to show the value in input signals currently.

Especially, the [P_u2r_o] & [P_u5P_n] are not only in zero & span of PV, but also randomly lower point in function [P_u2r_o] & randomly higher point in function [P_u5P_n]. The meter will be auto-linearization for full scale.

The adjustment can be cleared in function [P_5C_L_r].

*Please make sure that the [P_u2r_o] point must be less than [P_u5P_n] during the process of digital fine adjustment. Generally, the interval should be over 50% of input range. If the interval is too narrow, that may be made bigger error between zero and span,

Square root function [S_q_r_o_t]

Selectable no or YES ;

The function can be set no or YES in [i_nP_uT C_r_oU_P] to measure the signal from differential pressure flow-meter. The formula = $\sqrt{(P_v/H_S) \times H_S}$

Reading Stable Functions

Average Display update [A_v_g_e]

Settable range: 1~99 times;

Jittery Display caused by the noise or unstable signal. User can set the times to average the readings, and to get smoothly display.

Remark: To set the average times with higher will make the response time slower of Relay and Analogue output.

The meter's sampling is 15cycle/sec

If the [A_v_g_e](Average) set to be to express the display update with 5 times/sec.

The meter will calculate the sampling 1-3 and update the display value. At meantime, the sampling 4-6 will be processed to calculate.

Moving Average update [M_o_v_i_n_g]

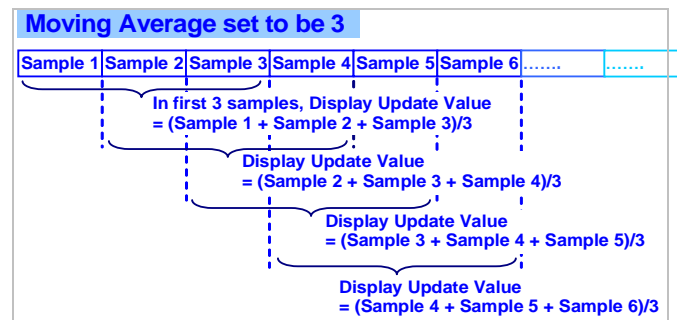

Settable range: 0(no function)/1~10 times;

Jittery Display caused by the reasons as like as noise or unstable signal. User can set the times to average the readings, and get smoothly display.

Remark: To set the moving average times with higher wouldn't affect the response time of Relay and Analogue output except the 1st updated display value will be slower.

The meter's sampling is 15cycle/sec. If the [M_o_v_i_n_g](Moving Average) set to be expressed the display update with 15 times/sec.,

In the first updated display value will be same as average function. In the next updated display value, the function will get the new fourth sample (sample 4) then throw away the first sample (sample 1) that the newest 3 samples(sample 2,3,4) will be calculated for the updated display value.

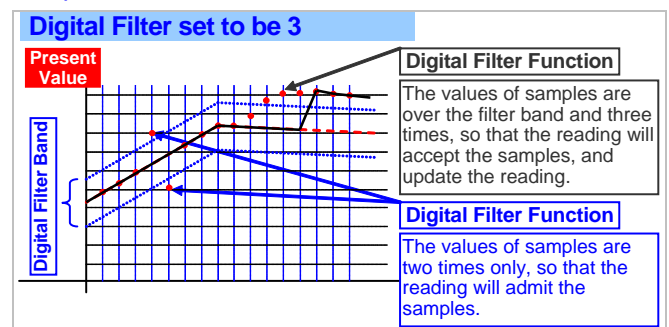

Digital filter [d_F_i_l_t_e_r]

Settable range from 0(None)/1~99 times.

The digital filter can reduce the influence of spark noise by magnetic of coil.

If the values of samples are over digital filter band(fixed in firmware and about 5% of stable reading) 3 times (Digital Filter set to be 3) continuously, the meter will admit the samples and update the new reading. Otherwise, it will be as treat as a noise and skip the samples.

Relay Functions

CS2 series offer the 4 relay outputs with more flexible and multi-functions. They can be programmable individually in [rELRY CoUP]. Please refer to the description as following;

Relay energized mode Hi / Lo / Go-1.2 / Go-2.3 / Hi.HLd / Lo.HLd / DO

- **Hi(Fig.1-①) (H):** Relay will be energized, when PV > Set Point
- **Lo(Fig.1-②) (Lo):** Relay will be energized, when PV < Set Point
- **Go-1.2(Fig.1-③) (Go-12):** This function is programmable for Relay 3 or 4 only. If the Relay 3 or 4 set to be Go function, the relay will compare between [rY1.5P] and [rY2.5P].

Go relay energized when the condition is [rY1.5P] (Hi) > PV > [rY2.5P] (Lo)

- **Go-2.3(Fig.1-③) (Go-23):** This function is programmable for Relay 4 only. If the Relay 4 set to be Go function, the relay will compare between [rY2.5P] and [rY3.5P].

Go relay energized when the condition is [rY2.5P] (Hi) > PV > [rY3.5P] (Lo)

Hi alarm & latch / Lo alarm & latch (Hi.HLd / Lo.HLd)

The relay energized with latched function is for electrical safety and human protection.

For example, a current meter relay installed for the over current alarm of motor. Generally, over current of motor caused by over load, mechanical dead lock, aging of insulation and so on. Above cases will alarm in the meter, if the user doesn't figure out the real reason and re-start the motor. It may damage the motor. The functions of Hi.HLD & Lo.HLD are designed must be manual reset the alarm after checking out and solving the issue. It's very important idea for electrical safety and human protection.

As the PV Higher (or lower) than set-point, the relay will be energized to latch except manual reset by from key in [user level] or [EC.] (ECI) set to be [YrSt] is closed.

DO(Digital Output) (DO)

The function has been designed not only a meter but also an I/O interface. In the case of motor control cabinet can't get the remote function. It's very easily to get the ON/OFF status of switch from CS2 series with RS485 function.

If the [rY.nd] had been set DO, the relay will be energized by RS485 command directly, but no longer to compare with set-point.

Start delay band [rY5b] and Start delay time [rY5d]

The functions have been designed for,

1. To avoid starting current of inductive motor (6 times of rated current) with alarm.
2. If the [rY.nd] relay energized mode had been set to be Lo(Lo) or Lo.HLd(Lo & latch). As the meter is power on and no input to display the "0" caused the relay will be energized. User can set a band and delay time to inhibit the energized of relay.

Start band [rY5b] (Fig.2-①):

Settable range from 0~9999 Digits

Start delay time [rY5d] (Fig.2-②):

Settable range from

0.0(second)~9(minutes)59.9(seconds);

Hysteresis [rY.HY] (Fig.3-①)

Settable range from 0~9999 Digits

As the display value is swing near by the set point to cause the relay on and off frequently. The function is to avoid the relay on and off frequently such as compressor.....etc.,

User can set a band to prevent from the relay on and off frequently

Relay energized delay [rY.rd] (Fig.3-②)

Settable range from

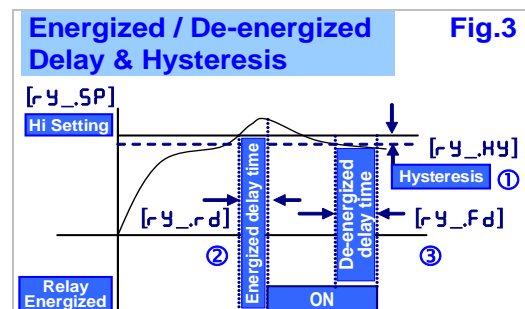

0.0(second)~9(minutes)59.9(seconds);

The function is to avoid the miss action caused by noise. Sometime, the display value will swing caused by spark of contactor.....etc.. User can set a period to delay the relay energized.

Relay de-energized delay [rY.Fd] (Fig.3-③)

Settable range from

0.0(second)~9(minutes)59.9(seconds)

3 External Control Inputs(ECI)

CS2 series offers 3 point external control inputs (ECI). They can be programmable individual with multi display and control functions. The front key function can be set to execute ECI function, but ECI terminals will be disabling. The ECI terminal input was designed by level trigger. Please refer to description as below,

Relative PV(Δ PV) or Tare (F.ELP.U)

The [EC] can be set to the F.ELP.U (Relative PV) function. When the ECI is closed, the reading will show the differential value with PV. Please refer to Display function section previously.

PV(Present value) Hold (P.uHL.d)

The [EC] can be set to the P.uHL.d (PV Hold) function. The display will be hold when the E.C.I. is closed except the ECI is to be open. Please refer to Display function section previously.

Reset Maximum or Minimum Hold (r.rSt) for PV

The [EC] function can be set to the r.rSt function to reset the maximum and minimum value by terminal of ECI.

Especially, the dSPLY function in [mPUt GrOP] can be set to the r.rSt or r.rSt to operate in coordination with DO of PLC. It is easier to achieve the maximum value testing in automation. Please refer to the below figures.

DI(Digital Input) (d.i)

The [EC] can be set to the d.i (Digital Input) function when the meter builds in RS485 port. The computer is easier to get a switch status through the meter as like as DI of PLC.

Reset for Relay Energized Latch (r.rSt)

If the relay energized mode has been set to be H.HL.d (High energized & latch), and the [EC] set to be r.rSt (Reset Relay function). When the PV matches the condition of relay energizing, the relay will be energized with latch except the ECI terminal is closed.

Bank selection (b.BnL) (for CS2-VA/CS2-RS)

Please refer to the function section (page 8/38) of this manual.

Analogue Output Functions

Please specify the output type either 0~10V or 4(0)~20mA in ordering code. The output low and high can be programmable which it's related with various display values. Reverse slope output is decided by reversing point positions.

Output range selection ([R.oL.YP])

Voltage output specified

Programming : $\underline{00-10}$ (0~10V) / $\underline{00-5}$ (0~5V) / $\underline{01-5}$ (1~5V)

Current output specified

Programming : $\underline{R4-20}$ (4~20mA) / $\underline{R0-20}$ (0~20mA) / $\underline{R0-10}$ (0~10mA)

Low Output corresponds to Low display value [R.oL.S]

Settable range: -19999~+29999;

Setting the Low Display value versus Low output range (as like as 4mA in $\underline{R4-20}$).

High Output corresponds to High display value [R.oH.S]

Settable range: -19999~+29999;

Setting the High Display value versus High output range (as like as 20mA in $\underline{R4-20}$).

*The interval between [R.oH.S] and [R.oL.S] should be with minimum over 20% of span; otherwise, it will reflect the less resolution of analogue output.

Fine Zero & Span Adjustment for Analogue Output

Users can get Fine Adjustment of analogue output by front key on the meter. Please connect standard meter to the terminals of analogue output for measuring the output value. To press the front key(up or down key) of meter for adjusting and checking the output.

Fine Zero Adjustment for Analogue Output [R.oZ.r.o]: Settable range: -38011~27524;

Fine Span Adjustment for Analogue Output [R.oSP.r.o]: Settable range: -38011~27524;

High Limited for Analog Output [R.oL.rSt] Settable range: 0.00~110.00% of High output;

User can set the output in high limit to avoid destroying the receiver or protection system.

■ RS 485 Communication

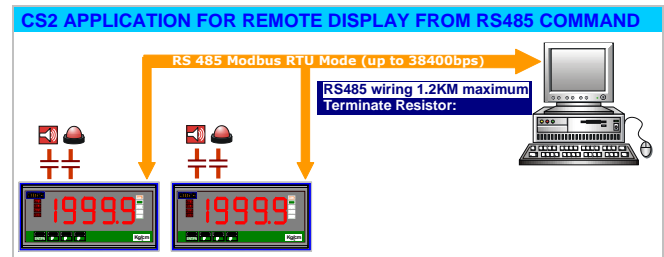

CS2 series can be used as Remote Terminal Unit (RTU) for monitoring and controlling in a SCADA (Supervisor Control And Data Acquisition) system. It's not only can be read the measured value and DI (external control inputs) status but also controls the relays output (DO) by RS485 communication ports.

- **Protocol:** Modbus RTU Mode
- **Baud Rate [bAud]:**
Programmable 1200/2400/4800/ 9600/ 19200/ 38400
- **Data Bits:** 8 bits
- **Stop Bits:** Programmable 1 bit or 2 bits
- **Parity [Pr tY]:** Programmable Even / Odd / None
- **Device Number [AdrES]:** Settable 1~255

■ Remote Display function [r5485]

CS2 series has been built-in an innovation function called remote display function.

In past, The meter only receive 4~20mA or 0~10V from AO card or BCD card of PLC. We support a new solution by RS485 for replacing the PLC's AO or BCD cards which it can save costs of AO and wiring to PLC.

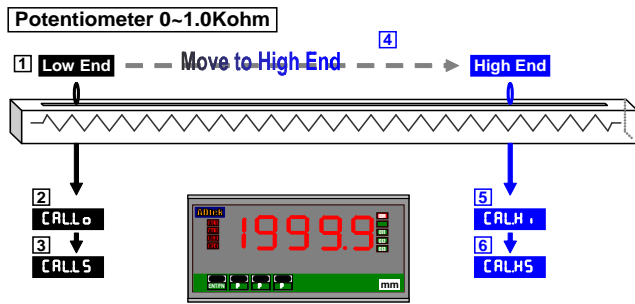

The data(number) will be same as PV that will compare with set-point, analogue output and ECI functions so the data could control analogue output, relay energized and so on.

■ Field Calibration (for CS2-SG / CS2-PM / CS2-RS)

In pass time, the engineers have to take a lot of time to adjust and calibrate meters or converters which the purpose of co-coordinating with zero and span of machinery structure for the Load Cell or Potentiometer measuring. Now, our CS2-SG, CS2-PM and CS2-RS with innovation functions against above to make the engineer operated easily and smoothly that it's called "Field Calibration". The procedures are described as below;

- Enter the right pass code [F.CodE] and access to the Field Calibration Level.
- Adjust the structures of machinery or & equipments to be "lower status".
- The low calibration of machinery structure is not need the exactly "zero" to calibrate, because of the "field calibration" function could be calibrate any lower point.
- Move next page to the [CALLo] and waiting for the value till stable, then pressed **ENT** Key to read the signal low of sensing device.
- Waiting for above reading stable (around 3~5seconds), press **ENT** Key again to complete the calibration lower point, and go to [CALL5].
- [CALL5] is the page of low scale setting that is relative to the calibration low point.
- Press **✓** Key to next function index [CALH i].
- Adjust the structures of machinery or & equipments to be "higher status".
- The high calibration of machinery structure is not need the exactly "span" to calibrate because of the "field calibration" function could be calibrating any higher point.
- In [CALH i] page, waiting for the value till stable, then pressed **ENT** Key to to read the signal high of sensing device.
- Waiting for above reading stable (around 3~5seconds), Press **ENT** Key again to complete the calibration higher point, and go to [CALH5].
- [CALH5] is the page of high scale setting that is relative to the calibration high point.
- Press **✓** Key to next functions [CSEL] to select **F.ELd**.
- [CSEL](Calibration parameter selection): Field calibration wouldn't change the default calibration. After user completing the field calibration, it can also select default calibration if the user wants.
 - ▶ As the user finished the procedures of field calibration, the field calibration datum has been saved in EEPROM and it can't change the default(factory) calibration datum. Even the field calibration has been done, the user can still select either default calibration or field calibration.
 - ▶ If the user select field calibration, the [Lo5C](step A-4) and [H.5C](A-5) will be replaced by [CALL5] and [CALH5] which it can not to be changed by anyone. If user has to change the scaling, it's the only way to access field calibration level to set in [CALL5](step F-2) and [CALH5](step F-4).
 - ▶ After selecting the **DEFLE** or **F.ELd**, please double check the [Lo5C](step A-4) and [H.5C](A-5) whether are corrected or not?

Please according to the numbers to do the field calibration (1 ⇒ 2 ⇒ 3 ⇒ 4 ⇒ 5 ⇒ 6)

Please according to the numbers to do the field calibration (1 ⇒ 2 ⇒ 3 ⇒ 4 ⇒ 5 ⇒ 6)

Bank Function(Suffix-3BK) for CS2-VA, CS2-RS

- The function is for CS2-VA and CS2-RS for controlling difference process with a same meter.
- For example; a pressure testing equipment; it has to measure multi-range with difference pressure transducers. The meter can be pre-set 4 groups parameters to show difference scales and relay energized with difference set-points. The operator just selects the bank number (bank1) to meet the process (product A). To make easier operating and to avoid making mistake in process operating.
- 4 banks pre-set for all relay functions are correspondence to 4 difference scaling, decimal point, above select by 3 External Control Inputs(E.C.I.) or front key.
- Example: Current testing

Product A: Current rated: 5A; NG: over 5A

Product B: Current rated: 100A; NG: over 100A

Setting: **BANK1**: [dP]: 0000 [LoSC]: 0000 [H .SC]: 5.000
 [r-y tnd]: H, [r-y ISP]: 5000 [r-y trd]: 000.5
BANK2: [dP]: 000 [LoSC]: 000 [H .SC]: 100.00
 [r-y tnd]: H, [r-y ISP]: 100.00 [r-y trd]: 00.10

[EC i.1]: BANK1 [EC i.2]: BANK2; connect a selector (or DO of PLC) to ECI1 and ECI2 terminals

- The order want to produce Product A must switch selector to A(Label A on panel), and ECI.1 close that the square green LED bright to express the meter will work as per bank1 set. When PV is over 5.000A that relay1 will be energized.
- The second order want to produce Product B must selector to B(Label B on panel), and ECI.2 close that the square green LED bright to express the meter will work as per bank2 set. When PV is over 100.00A that relay1 will be energized..
- Only 1 Bank can be selected, if it is double selection. The priority is Bank1 > Bank2 > Bank3 in order,

ORDERING INFORMATION

CS2-VA - DC/AC/ TRMS Input Signal - Relay Output (OPTION 1) - Analogue Output (OPTION 2) - RS 485 Port (OPTION 3) - Aux. Powered - *Optional Functions. Customize function is welcome. Please contact with our sales window for detail.

Dimensions & Panel Cut Out

Installation

Wiring Diagram

Please check the voltage of power supplied first, and then connect to the specified terminals. Herein, recommended that power supplied with protection by a fuse or circuit breaker to the meter.

Connector

CS2-VA: #A1~A3(Signal Input): 20A/300Vac, M3.5, 1.3~3.5mm² (22~12AWG); Max torque: 13Kg-cm

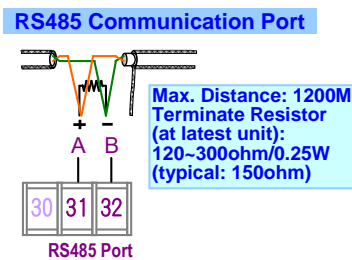

Others: 10A 300Vac, M2.6, 1.3~2.0mm² (22~16AWG), Max torque: 5Kg-cm. Please use cord end terminal.

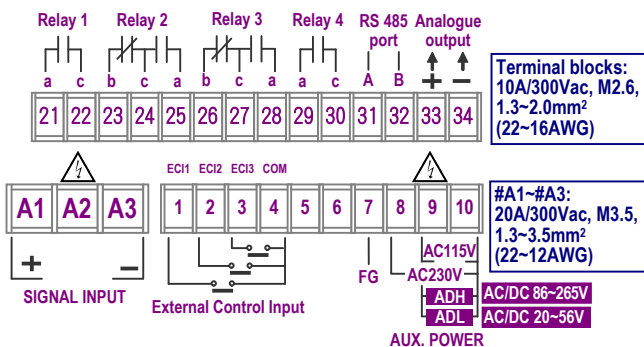

Please set the torque of automotive screwdriver to match the limited of terminals.

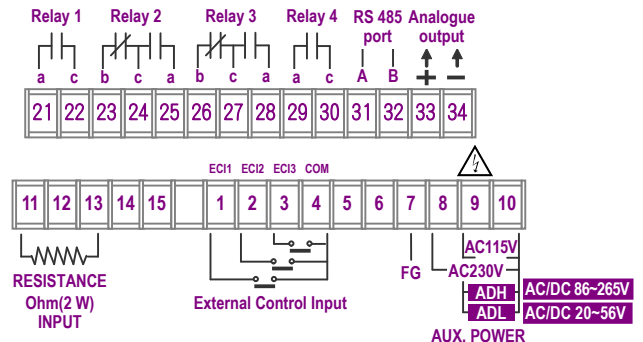

For input, RS485 and ECI wiring, Herein recommended using twin wire with shielding.

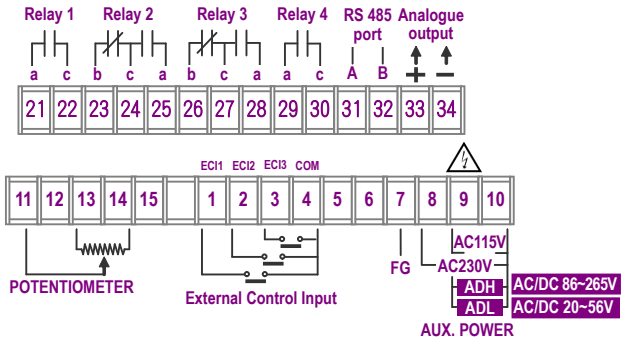

[CS2-VA Voltage / Current Meter Relay]

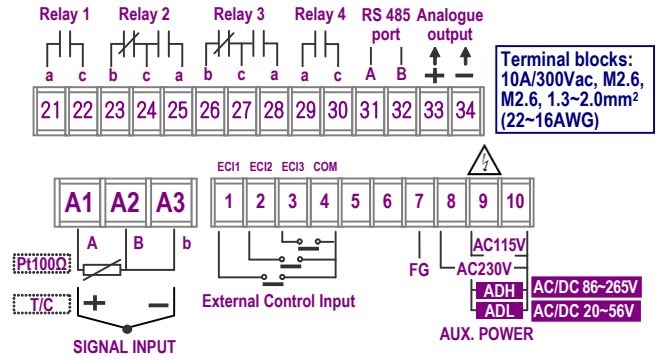

[CS2-RS Resistance Indicator]

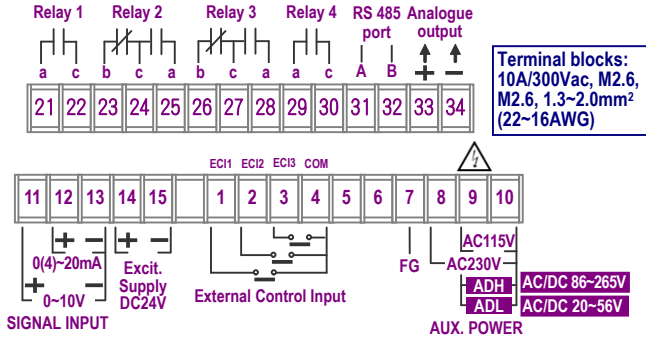

[CS2-PM Potentiometer Indicator]

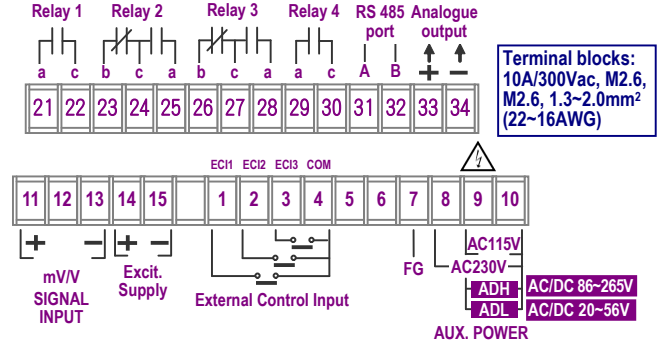

[CS2-T Temperature Indicator]

[CS2-PR DC Process (10V/20mA) Indicator]

OPERATIONS

Front Panel

Numeric Screens

0.8”(20.0mm) red high-brightness LED for 4 2/3 digital present values.

I/O Status Indicators

Relay Energized: 4 square red LED

- RL1** display when Relay 1 has been energized;
- RL2** display when Relay 2 has been energized;
- RL3** display when Relay 3 has been energized;
- RL4** display when Relay 4 has been energized;

External Control Input Energized: 3 square green LED

- ECI1** display when E.C.I. 1 has been closed(dry contact)
- ECI2** display when E.C.I. 2 has been closed(dry contact)
- ECI3** display when E.C.I. 3 has been closed(dry contact)

RS485 Communication: 1 square orange LED

COM will flash express the meter is receive or send data, and **COM** flash quickly means the data transient quicker.

Max/Mini Hold indication: 2 square orange LEDs

M.H displayed: To display function expressed it has been selected in Maximum or Minimum Hold function.

Stickers:

Each meter with a sticker to describe what the functions together with engineer label enclosure.

Functions stickers

Operating Key: 4 keys for Enter(Function) / Shift(Escape) / Up key / Down key. Please refer to detail description in next page.

Pass Code: Settable range:0000~9999;

User must key-in the exactly pass code for access to [Programming Level]. Otherwise, the meter will return to measuring page. If user forgets the pass code, please contact with your service window.

Function Lock: There are 4 levels programmable.

- **None(nonE):** no lock at all. User can access to all level for checking and setting.
- **User Level(U5Er):** User Level lock. User can access to User Level for checking, but can not setting.
- **Programming Level(EnG):** Programming level lock. User can access to programming level for checking, but can not setting.
- **ALL(RLL):** All lock. User can access to all level for checking but can not setting.

Front Key Function [E.1=UP] & [E.2=dn]

- The Key can be set to be the same function as the setting of [EC 1](ECI).
Ex. The [EC 1] set to be **Pu.Hld** and the function [E.1=UP] set to be **YES** in [EC 1 Gr oUP]. When user presses Key, the PV will hold as like as terminals of ECI1 close.
- The Key can be set to be the same function as the setting of [EC 2].
Ex. The [EC 2] set to be **REL.PU** and the function [E.2=dn] set to be **YES** in [EC 1 Gr oUP]. When user presses Key, the PV will show relative value as like as terminals of ECI2 close.

If the front key function has been set, the terminal input for ECI will be disabling.

■ Error Message

BEFORE POWER ON, PLEASE CHECK THE SPECIFICATION AND CONNECTION AGAIN.

SELF-DIAGNOSIS AND ERROR CODE:

DISPLAY	DESCRIPTION	REMARK
ouFL	Display is positive-overflow (Signal is over display range)	(Please check the input signal)
-ouFL	Display is negative-overflow (Signal is under display range)	(Please check the input signal)
ouFL	ADC is positive-overflow (Signal is higher than input 120%)	(Please check the input signal)
-ouFL	ADC is negative-overflow (Signal is lower than input -120%)	(Please check the input signal)
EEP → FA iL	EEPROM occurs error	(Please send back to manufactory for repaired)
A i.C.nG ← Pu	Didn't execute the calibrate of Input Signal	(Please process Calibrating Input Signal)
A i.C ← FA iL	Input signal calibrated error	(Please check Calibrating Input Signal)
AoC.nG ← Pu	Didn't execute the calibrate of output Signal	(Please process Calibrating Output Signal)
AoC ← FA iL	Output Signal calibrated error	(Please check Calibrating Output Signal)

■ Operating Key:

*Please access to the Programming Level to check and set the parameters when users start to run the meter

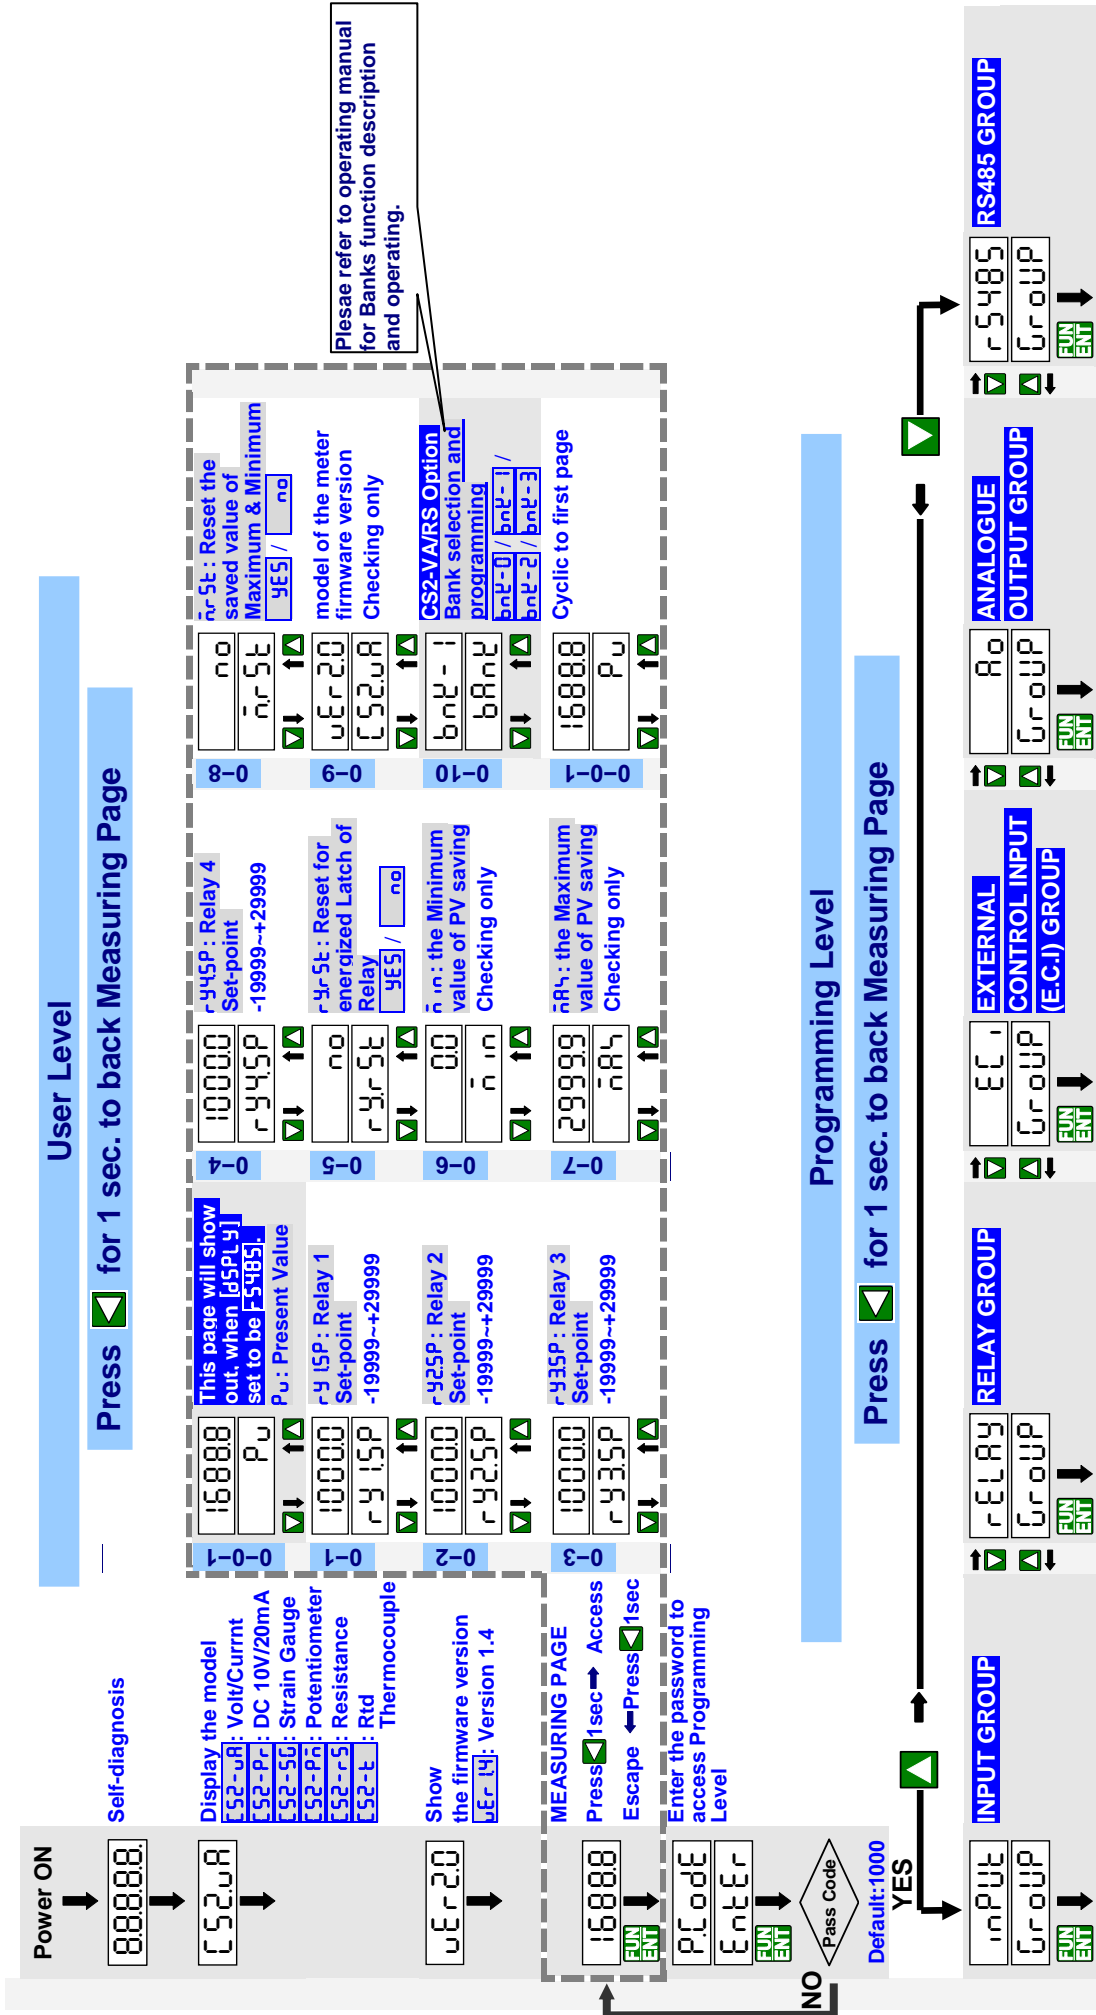

■ **Operating Key:** 4 keys for  Enter(Function) /  Shift(Escape) /  Up key /  Down key

■ The meter has designed operation similar as PC's   and . In any page, press  key means "enter" or "confirm setting", and press  key means "escape ()" or "shift".

■ In Programming Level, the screen will return to Measuring Page after do not press any key over 2 minutes, or press  for 1 second.

	Function Index	Setting Status
 (=  Enter/Fun key	(1) In any page, press  to access the level or function index (2) From the function index to access setting status	(3) Setting Confirmed, save to EEProm and go to next function index
 (=  Shift key	(1) In measuring page, press  for 1 second to access user level. (2) In function index, press  for 1 second to go back upper level. (3) In function group index, press  for 1 second to go back measuring page	(4) In setting status, press  to Shift the setting position. (5) In setting status, press  for 1 second to abort setting and go back this function index.
 (=  Up key	(1) In function index, press  to go back to previous function index	(2) In setting status for function, press  to select function (3) During number Setting, press  can roll the digit up
 (=  Down key	(1) In Function Index Page, press  will go to the next Function Index Page.	(2) In setting status for function, press  to select function (3) During number Setting, press  can roll the digit down.

OPERATING FLOW CHART: Please refer to operating manual for detail description

Programming Level

Press for 1 sec. to back Measuring Page

88888
CALLo

↑ ↓

Adjust the structure to be a lower signal output status (or any lower status) and keep it in stable.

[CALLo] : Field Calibration Low

- Press **ENT** to read signal of the lower status.
- Press **ENT** again to finish the calibration lower point, and go to next page.

88888
CALLS

↑ ↓

[CALLS] : the value to be set is relative to Field Calibration lower point

- Press **ENT** to set the value of lower scale

88888
CALHi

↑ ↓

Adjust the structure to be a higher signal output status (or any higher status) and keep it in stable.

[CALHi] : Field Calibration High

- Press **ENT** to read signal of the higher status
- Press **ENT** again to finish the calibration higher point, and go to next page.

88888
CALHS

↑ ↓

[CALHS] : the value to be set is relative to Field Calibration higher point

- Press **ENT** to set the value of Higher scale

DEFLE

↑ ↓

[SEL] : Calibration parameter selection

- Press **ENT** to access the function and stand by selection
- Press **↑** or **↓** to select (default: DEFLE);
Settable: DEFLE / FLELD

[FLELD] (default calibration) [FLELD] (Field calibration)

Once the user select field calibration, the [a5C] (step A-4) and [H a5C] (A-5) will be instead of [RLLS] and [RLHS], and can not to be change. If user has to change the scaling, it's the only way to access field calibration level to set in [RLLS] (step F-2) and [RLHS] (step F-4).

Please double check the [a5C] (step A-4) and [H a5C] (A-5) are correct after selection the [DEFLE] or [FLELD]

■ TROUBLE SHOOTING

Display Issue:

PROBLEM	CHECKING LIST	REMEDY
Display shows  	<p>1.To inspect whether did the input signal type (V/A/mA..) of meter match with field signal or not?</p> <p>2.To inspect whether the input signal is over +120% (input high limit) or -120% (input low limit)?</p> <p>3. To inspect whether did the wires connect correct and secure or not?</p>	<p>Please change another meter that is matching in the field.</p> <p>► For CS2-PR, input range can be programmed in same type(mA or V). Please check the [R tYP] in [INPUt GRoUP].</p> <p>A.Please check the [R tLo] and [R tHi] in [INPUt GRoUP] are correct or not.</p> <p>B.Please changes another meter that is matching in the field.</p> <p>A.Please checks carefully the connection diagram of label on the meter.</p> <p>B.Please uses the terminals(Y, Ring or cord end terminal) to avoid the risk of insecure.</p>
Incorrect ion display value or out of accuracy	<p>1. To inspect the input signal type (V/A/mA..) or range of meter whether did match with signal in the field or not?</p> <p>2.To inspect the settings of high and low scale whether did it correct or not?</p> <p>3.To inspect the high and low fine adjustments of PV are changed or not?</p> <p>CS2-Pr:</p> <p>4.To inspect the input signal range whether did it match with signal in the field or not?</p> <p>CS2-SG/CS2-PM</p> <p>5.To inspect the field calibration whether did it match with sensor in the field or not?</p>	<p>A.Please check the [R tLo] and [R tHi] in the [INPUt GRoUP] whether did the both set correct or not ? Generally, the [R tLo] is % and [R tHi] is %, if the input specification of meter is same as range of signal in field.</p> <p>B.Please changes another meter that is matching in field.</p> <p>Please check the [H tSC](A-05) and [LoSC](A-04) in [INPUt GRoUP].</p> <p>Please check the [P uSPn](A-07) and [P uPrLo](A-06) in [INPUt GRoUP] whether did the values can be cleared in [P5CLR](A-08).</p> <p>Please check the [R tYP](A-00) that has to match the signal in the field.</p> <p>Please check the [CLL5](F-02) and [CLH5](F-04) both are matched the measuring range of sensor.</p>
Jittery Display	<p>1.To inspect the input signal is jittery or not?</p> <p>2.To inspect the input signal is stable.</p>	<p>A.If the input signal is jittery continuously, please set higher value in [R uG](A-11) or [h uR uG](A-12)</p> <p>B.If the input signal is jittery uncertain period that caused by the inductive load actions, please set higher value in [dF tL t](A-13)</p> <p>C.Please does not lay the wires of input together with high-voltage lines or power lines. As a general rule, wire the meter in a separate system, use an independent metal conduit, or use shielded cable.</p> <p>A.If the input signal is jittery continuously, please set higher value in [R uG](A-11) or [h uR uG](A-12)</p> <p>B.If the input signal is jittery uncertain period that caused by the inductive load actions, please set higher value in [dF tL t](A-13)</p> <p>C.Please connects an isolation transformer as close as meter in power lines.</p>
Display shows "-----"	<p>To inspect display function [d5PL Y]. It's maybe to be set to </p>	<p>Please check the [d5PL Y](A-09) in [INPUt GRoUP] and change the function setting from  to .</p>
display value doesn't change	<p>1.To inspect display function [d5PL Y]. It's maybe to be set to  (maximum hold) or  (minimum hold), and the M.H LED is brighten.</p> <p>2.To inspect external control input function [EC t]. It's maybe to be set to , and the relate LED is brighten.</p>	<p>Please check the [d5PL Y](A-09) in [INPUt GRoUP] and change the function set from  or  to .</p> <p>A.Please check the [EC t](C-01/02/03) in [EC t GRoUP] and change the function setting from  to .</p> <p>B.ECI function has been energized by terminals close. Please open the terminals.</p>

Relay Output Issue:		
PROBLEM	CHECKING LIST	REMEDY
The parameters of Relay doesn't shown	Check if the label of meter for detail specification.	A.Please check the product number and output(O/P:_____) description again for confirmation the relay output is specified or not? B.Please send back to our sales window, or order another meter with relay function.
Relay cans not action.	The relay energized, but square red LED doesn't bright	
	1.Check the energized mode	Please check the [rY lnd](B-03/07/11/15) in the [RELAY GROUP]
	2.Check the delay time and delay band in the start delay function.	Please check whether the [rYsb] (B-01) did is too wide and [rY5d](B-02) is too long in [RELAY GROUP] or not?
	3. Check the energized delay time	Please check whether did the [rY lnd](B-05/09/13/17) is too long in [RELAY GROUP] or not?
	The relay energized, but square red LED dose bright	
1.Check the wiring of relay output	According to the label of meter, please check again the connection wire of relay. Be careful to check the number of relay is matching the setting.	
2.Check the voltage of supply power		

Analogue Output Issue:		
PROBLEM	CHECKING LIST	REMEDY
Incorrect ion analogue output value or out of accuracy	1. To inspect the output signal type (V/A/mA..) or range of meter whether did match with signal in the field or not?	A.Please check the product number and output(O/P:_____) description again for confirmation the analogue output is specified or not? If it was not specified, please send back to our sales window, or order another product with relay function. B.Please confirm the output type is correct and check the range in [RoltYP](D-01) of [Ro GROUP]
	2. Check the Analogue output high and low setting.	A.Please check the [RoltS](D-02) and [RoltHS](D-03) in [Ro GROUP].
Jittery Analogue Output	Analogue output is according to the display	
	1.Check if the display is jittery	A.If the input signal was jittery continuously, please set higher value in [RulG](A-11) or [RulRG](A-12) B.If the input signal is jittery with a uncertain period that caused by the inductive load actions, please set higher value in [dF lLl](A-13) C.Please does not lay the wires of input together with high-voltage lines or power lines. As a general rule, wire connecting with the meter has to be in a separate system, use an independent metal conduit, or use shielded cable.
	2.Check if the display is stable	Please do not lay the wires of output together with high-voltage lines or power lines. As a general rule, wire connecting with the meter has to be in a separate system, use an independent metal conduit, or use shielded cable.

RS485 Communication Issue:		
PROBLEM	CHECKING LIST	REMEDY
Can not link	Check if the square orange LED of RS485 doesn't bright.	A.Please check the [RdrES](E-01) \ [bRUd](E-02) and [Pr lty](E-03) in [RS485 GROUP] that both have to match the Host. B.Please check the wiring A(+) and B(-) are correct or not? C.If user uses a converter (RS485/RS232 or RS485/USB..), please check the converter of setting and wiring is correct or not? D.Please check the protocol of host is Modbus RTU Mode
Reply wrong data from the meter	1.Check if the square orange LED of RS485 dose bright, but no reply.	A.Please confirms the CHECH SUM program is correct. B.Please check the interval of each command has to over 3.5byte.

<p>2. Check if the square orange LED of RS485 dose bright, but reply Error.</p>	<p>A.Please checks the address table of RS485 to assume whether did the address right or not? B.Please checks the start address and data format are correct. C. Please do not lay the wires of RS485 together with high-voltage lines or power lines. As a general rule, wire the meter in a separate system, use an independent metal conduit, or use shielded cable.</p>
